

ASTR 1020: Stars & Galaxies

October 4, 2013

- Reading: Chapter 16.
- *Mastering Astronomy* Homework on **The Properties of Stars** is due tonight at midnight.

Astronomy in the News: Voyager 1 probe has left the solar system

Natalie Stinson

Today's Class: The HR Diagram & Star Clusters

- Masses & Lifetimes of Stars.
- Measuring stellar ages with Star Clusters.

Reading Clicker Question: Which type of star is no longer undergoing nuclear fusion?

- A. supergiants
- B. M stars
- C. main-sequence stars
- D. white dwarfs
- E. none of the above (all have nuclear fusion)

Reading Clicker Question: Which type of star is no longer undergoing nuclear fusion?

- A. supergiants
- B. M stars
- C. main-sequence stars
- D. **white dwarfs**
- E. none of the above (all have nuclear fusion)

Hertzsprung-Russell (H-R) diagram

Stellar Properties Review

Luminosity: from brightness and distance

$$(0.08 M_{\text{Sun}}) 10^{-4} L_{\text{Sun}} - 10^6 L_{\text{Sun}} (100 M_{\text{Sun}})$$

Temperature: from color and spectral type

$$(0.08 M_{\text{Sun}}) 3,000 \text{ K} - 50,000 \text{ K} (100 M_{\text{Sun}})$$

Mass: from period (p) and average separation (a) of binary-star orbit

$$0.08 M_{\text{Sun}} - 100 M_{\text{Sun}}$$

Mass & Lifetime

Sun's life expectancy: 10 billion years

Until core hydrogen
(10% of total) is
used up

Life expectancy of 10 M_{Sun} star:

10 times as much fuel, uses it 10^4 times as fast

$$10 \text{ million years} \sim 10 \text{ billion years} \times 10 / 10^4$$

Life expectancy of 0.1 M_{Sun} star:

0.1 times as much fuel, uses it 0.01 times as fast

$$100 \text{ billion years} \sim 10 \text{ billion years} \times 0.1 / 0.01$$

Main-Sequence Star Summary

High Mass:

- High Luminosity
- Short-Lived
- Large Radius
- Blue

Low Mass:

- Low Luminosity
- Long-Lived
- Small Radius
- Red

What are giants, supergiants, and white dwarfs?

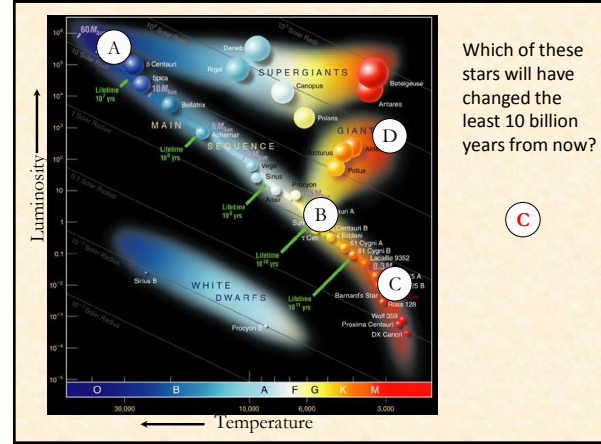

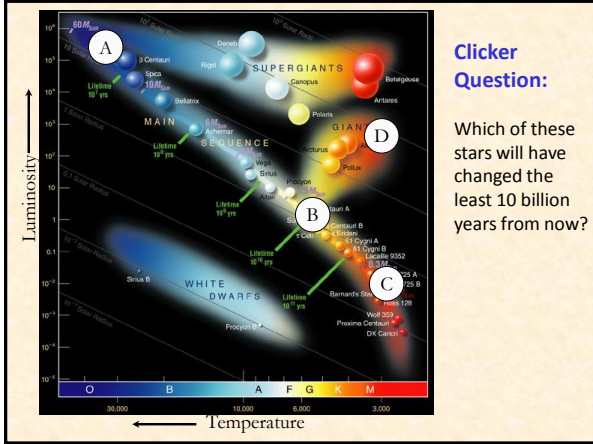

Sizes of Giants and Supergiants

Off the Main Sequence

- Stellar properties depend on both mass and age: those that have finished fusing H to He in their cores are no longer on the main sequence.
- All stars become larger and redder after exhausting their core hydrogen: **giants** and **supergiants**.
- Most stars end up small and white after fusion has ceased: **white dwarfs**.

- ### What have we learned?
- **What is a Hertzsprung-Russell diagram?**
 - An H-R diagram plots stellar luminosity of stars versus surface temperature (or color or spectral type)
 - **What is the significance of the main sequence?**
 - Normal stars that fuse H to He in their cores fall on the main sequence of an H-R diagram
 - A star's mass determines its position along the main sequence (high-mass: luminous and blue; low-mass: faint and red)

- ### What have we learned?
- **What are giants, supergiants, and white dwarfs?**
 - All stars become larger and redder after core hydrogen burning is exhausted: **giants** and **supergiants**
 - Most stars end up as tiny **white dwarfs** after fusion has ceased

- ### Star Clusters
- What are the two types of star clusters?
 - How do we measure the age of a star cluster?

Pleiades star cluster

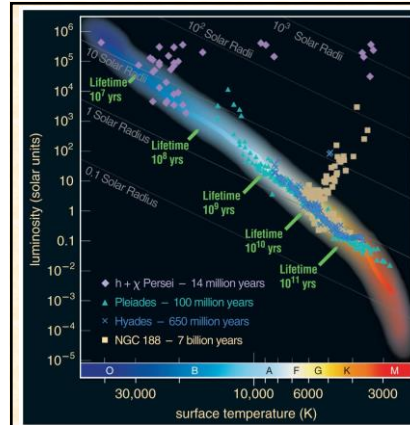

Open cluster: A few thousand loosely packed stars

Globular cluster: Up to a million or more stars in a dense ball bound together by gravity

How do we measure the age of a star cluster?

Main-sequence turnoff point of a cluster tells us its age

What have we learned?

- **What are the two types of star clusters?**
 - Open clusters are loosely packed and contain up to a few thousand stars
 - Globular clusters are densely packed and contain hundreds of thousands of stars
- **How do we measure the age of a star cluster?**
 - A star cluster's age roughly equals the life expectancy of its most massive stars still on the main sequence
